

Assessment Summary – BS in Information Systems

The **Information Systems** program has ten Student Learning Outcomes (SLOs) which correspond to the program outcomes that are identified by the ABET Engineering Accreditation Commission documents. The assessment procedures include both direct and indirect measures. The number of assessed courses continues to ramp up as more advanced-level courses are added each year. Data are gathered each semester for all outcomes.

The **Information Systems** program has used observations from the assessment process to make the undergraduate degree program more flexible to allow students to tailor a program to meet their specific needs. In addition, the assessment process has generated information that is useful to identify changes needed in prerequisites and/or changes to courses to fill missing concepts. The improvements have worked to the extent that students show a greater satisfaction with the undergraduate degree programs and in understanding the interdependencies between courses in the curriculum. Recently, the department updated the Student Learning Outcomes to more closely align assessments with requirement of the new ABET Assessment Process. In 2009, the department plans to completely automate the assessment gathering process so that information from individual instructors will be entered into a secure database system. In particular, we plan to require individual faculty members to answer these same questions for their individual courses. The Assessment Committee will still meet with individual instructors and analyze the overall curriculum for changes needed to mesh the courses together in a cohesive whole.
