It is with great pleasure I share the 2010 annual research report for the Kansas State University Department of Computing and Information Sciences (CIS). The CIS department continues to move forward strongly with our faculty excelling in research and teaching. Our graduate program continues to grow, our students are in high demand, and we have strong interdisciplinary teaching and research programs.

In 2010, the Center for Information and System Assurance (CISA) in CIS, with Dr. Simon Ou as director, was designated as a National Center of Academic Excellence for Research in Information Assurance by the National Security Agency and Department of Homeland Security for the period 2010-2015. This designation was received based on the excellent record of CIS faculty in research, extramural funding and teaching in cybersecurity, as well as external collaborations with leading researchers in both academia and industry.

I am also pleased to note that Dr. Eugene Vasserman joined our department as an assistant professor starting fall 2010. He completed his Ph.D. in computer science from the University of Minnesota in Minneapolis in 2010, specializing in the area of computer security.

As a significant achievement, Dr. John Hatcliff and Dr. Robby received the International Conference on Software Engineering prestigious Most Influential Paper Award for their paper “Bandera: extracting finite-state models from Java source code” published in 2000. The Most Influential Paper Award is given jointly by ACM and IEEE at the world’s premier software engineering conference, to the paper that is judged to have had the most influence on the theory and practice of software engineering during the 10 years since its original publication. Separately, this paper also received the Impact Paper Award from ACM SIGSOFT.

Our faculty continue to be strong in multidisciplinary research. In 2010, a multidisciplinary, five-year, $3 million project led by Dr. Mitch Nielsen from CIS was funded by the NSF GK-12 STEM Fellows program. This project, with collaborators Virg Wallentine (CIS), Nathan Bean (CIS), Gurdip Singh (CIS), Naqian Zhang (biological and agriculture engineering) and Jackie Spears (education), will place up to eight graduate students each in up to 16 schools to integrate information technology and sensor systems into K-12 curriculum.

We renovated several classrooms and labs in Nichols Hall in 2010 to provide a better learning environment for students. This includes making Nichols 126 available 24 hours a day to students exclusive as their work area. Our ACM student chapter, advised by Dr. Dan Andresen, has been very active in engaging students in activities. Their accomplishments include a 3rd-place finish in the High-Performance Computing Contest held at the International SuperComputing Conference in New Orleans in November 2010; and four teams placing 3rd, 6th, 10th and 15th among 32 teams competing at the ACM Programming Contest held in Lincoln, Nebraska, in 2010.

The 2010 annual report cannot cover all CIS accomplishments for the year. Please visit our website at http://www.cis.ksu.edu for a more complete picture.

Gurdip Singh
Department Head
Computing and Information Sciences
Kansas State University
Today’s software is at least an order of magnitude more complex than that being developed a decade ago. Users today are demanding applications that operate autonomously, adapt in response to dynamic environments and interact with other distributed applications in order to provide solutions to a wide range of problems. To respond appropriately, software needs to be aware of what it is doing and why, in order to take the appropriate steps to achieve its objectives. There are several instances of these kinds of systems including information systems, service-oriented systems, wireless sensor networks and multi-robot systems. In each of these types of systems, one key element of adaptivity is the allocation of tasks to appropriate system elements. However, an equally important aspect of adaptivity is understanding why those tasks need to be performed.

Self-adaptive systems are designed in a top-down, engineering approach. This is in contrast to self-organizing systems where system behavior emerges from the composition of components that act and interact locally. Self-adaptive systems evaluate their current behavior in light of their overall objectives and change that behavior to better achieve their goals. What is “better” depends on the application. Typical objectives include efficiency, robustness or secure operation. One of the key challenges of self-adaptive systems is allowing the system to adapt its behavior without introducing unintended consequences. Science fiction is replete with examples of intelligent systems that become smarter than their human creators.

For the past several years, the K-State CIS Multiagent and Cooperative Reasoning (MACR) Laboratory has brought together researchers with various expertise to solve interesting problems in the area of distributed, intelligent and self-adaptive systems. Application areas have included multiagent systems, cooperative robotics, sensor networks and a wide variety of networked systems. MACR Lab research incorporates existing methodologies and techniques from other related disciplines — including artificial intelligence, robotics and software engineering — into an integrated and comprehensive approach to developing distributed, self-adaptive systems. Current research areas include the following:

- Development of methodologies, techniques, models and tools to support the creation of self-adaptive systems that can adapt to achieve their overall goals without the threat of destructive and unexpected behavior. MACR lab researchers have developed a tailored methodology, the organization-based multiagent systems engineering (O-MaSE) methodology, that allows designers to create highly adaptive systems based on an organization-theoretic approach. The O-MaSE methodology and its accompanying integrated design and development environment, agentTool, have been used to develop adaptive multiagent systems at K-State and several other institutions around the world. These designs are translated into systems that use runtime models to determine their current state of problem solving and adapt their behavior to produce an efficient solution.

- Use of semi-autonomous robot teams for dangerous missions such as search and rescue, minefield operations, reconnaissance and surveillance, ordnance detection and clearance, and urban warfare. Currently deployed ground robots typically require one operator per robot, while more sophisticated UAVs require multiple operators due to the concurrent demands of control, monitoring and decision-making. CIS researchers have been working on key technologies to allow a small number (one or more) of operators to control multiple teams of robots in a variety of applications. This technology will be able to be widely applied to multiple situations where human operators need to provide oversight and control of teams of semi-autonomous robotic vehicles.

- Collaborative human-robot teams where humans and robots are deployed side by side as partners on missions that require tightly integrated and choreographed activities. These combined teams will require team members to adapt to each other, the environment and the state of the team problem-solving process.
Gurdip Singh
Associate Professor
Ph.D., Computer Science, State University of New York at Stony Brook, 1991
M.S., Computer Science, State University of New York at Stony Brook, 1989
B.Tech., Computer Science and Engineering, Indian Institute of Technology, 1986
Research: Applied algorithms, middleware services, sensor networks, optimization, modular design.
Teaching: Distributed computing, network protocols, operating systems, embedded systems.

Torben Amtoft
Associate Professor
Ph.D., Computer Science, University of Aarhus, 1993
M.Sc., Computer Science, University of Copenhagen, 1989
B.Sc., Mathematics and Computer Science, University of Copenhagen, 1985
Research: Program analysis, language-based security, program slicing, information-flow analysis, dependency analysis.
Teaching: Databases, algorithms, logic and verification, formal language theory, programming languages.

Daniel Andresen
Associate Professor
Ph.D., Computer Science, University of California, Santa Barbara, 1997
M.S., Computer Science, California Polytechnic State University, SLO, 1992
B.S., Computer Science and Mathematics, Westmont College, 1990
Research: Parallel and distributed computing, scheduling and run-time systems, high-performance scientific computing, distributed-sensor networks, telemedicine.
Teaching: Operating systems, distributed systems, computer architecture, WWW technology.

Doina Caragea
Assistant Professor
Postdoctoral, Computer Science, Iowa State University, 2004-2006
Ph.D., Computer Science, Iowa State University, 2004
M.S., Computer Science, University of Bucharest, Romania, 1997
B.S., Computer Science, University of Bucharest, Romania, 1996
Research and teaching: Bioinformatics, artificial intelligence, machine learning, data mining and knowledge discovery, visual data mining, ontologies and information integration, information retrieval and semantic web.

Scott A. DeLoach
Associate Professor
Ph.D., Computer Engineering, Air Force Institute of Technology, 1996
M.S., Computer Engineering, Air Force Institute of Technology, 1987
B.S., Computer Engineering, Iowa State University, 1982
Research: Applying software engineering methods, techniques, and models to design and development of intelligent, complex, adaptive, and autonomous multiagent systems; building tools and techniques necessary to design and build cooperative robotic systems; building and developing hybrid intelligent systems that include humans, software agents, and mobile hardware agents.
Teaching: Agent-oriented software engineering, software engineering, software management.

David A. Gustafson
Professor
Ph.D., Computer Science, University of Wisconsin, 1979
M.S., Computer Science, University of Wisconsin, 1973
B.S., Meteorology, University of Utah, 1969
Research and teaching: Software engineering, software metrics, software testing, design analysis, robotics, vision, face recognition, emotion recognition, biometrics, healthcare applications of robots.

John Hatziff
Professor
Ph.D., Computer Science, Kansas State University, 1994
M.Sc., Computer Science, Queens University, Kingston, Ontario, Canada, 1991
B.A., Computer Science/Mathematics, Mount Vernon Nazarene College, 1988
Research: Formal methods in software engineering, software verification, security analysis and certification, model checking, static analyses of programs, concurrent and distributed systems, middleware, model-integrated computing, semantics of programming languages, compiler construction, logics and type theory.
Teaching: Foundations of programming languages, software specification and verification, logic and set theory, construction of concurrent systems, compiler construction, formal language theory, software engineering, functional programming, logic programming.

Radney Howell
Associate Professor
Ph.D., Computer Science, The University of Texas at Austin, 1988
B.S., Computer Science, Wichita State University, 1984
Research: Real-time scheduling, algorithm analysis, self-stabilizing systems.
Teaching: Analysis of algorithms, data structures, formal language theory, symbolic logic, real-time scheduling theory.

William Hsu
Associate Professor
Ph.D., Computer Science, University of Illinois at Urbana-Champaign, 1998
M.S., Computer Science, Johns Hopkins University, 1993
B.S., Computer Science and Mathematical Sciences, Johns Hopkins University, 1993
Research: Laboratory for Knowledge Discovery in Databases (KDD)—research group emphasizing machine learning and intelligent systems.

Masaki Mizuno
Professor
Ph.D., Computer Science, Iowa State University, 1987
M.S., Computer Science, Pennsylvania State University, 1982
M.S., Electrical Engineering, Kelo University, Japan, 1980
B.S., Electrical Engineering, Kelo University, Japan, 1978
Research and teaching: Operating systems, distributed systems, real-time embedded systems, object-oriented systems.

Mitch Neilson
Associate Professor
Ph.D., Kansas State University, Computer Science, 1992
M.S., Kansas State University, Computer Science, 1989
M.S., Kansas State University, Mathematics, 1987
B.S., University of Nebraska-Kearney, Mathematics, 1982
Research: Distributed computing systems, real-time embedded systems, computational engineering, natural resources.
Teaching: Computer architecture, operating systems, networking, real-time systems.

Xinming (Simon) Ou
Assistant Professor
Ph.D., Computer Science, Princeton University, 2005
M.E., Computer Science, Tsinghua University, 2000
B.E., Computer Science, Tsinghua University, 1998
Research and teaching: Computer security, enterprise network defense, intrusion detection and analysis, security metrics, programming languages, high-assurance systems.
Robby
• Associate Professor
  Ph.D., Computer Science, Kansas State University, 2004
  M.S., Computer Science, Kansas State University, 2000
  B.S., Computer Science, Oklahoma State University, 2000
Research: Software verification, specification, analysis, transformation, specialization, testing, software engineering, model-driven software development.
Teaching: Specification and verification of software, programming languages, compiler design and implementation.

David A. Schmidt
• Professor
  Ph.D., Computer Science, Kansas State University, 1981
  M.S., Computer Science, Kansas State University, 1977
  B.A., Mathematics, Fort Hays State University, 1975
Research: Abstract interpretation, static program analysis, denotational semantics.
Teaching: Programming methodology, program validation, software architecture.

Eugene Vasserman
• Assistant Professor
  Ph.D., Computer Science, University of Minnesota, 2010
  M.S., Computer Science, University of Minnesota, 2008
  B.S., Biochemistry, Neuroscience, University of Minnesota, 2003
Research: Distributed system security, privacy and anonymity, peer-to-peer systems, network security, medical and embedded device security, applied cryptography usable security.
Teaching: Secure networks and distributed systems.

Virgil Wallentine
• Professor
  Ph.D., Computer Science, Iowa State University, 1972
  M.S., Computer Science, Iowa State University, 1970
  B.S., Mathematics, Iowa State University, 1965
Research: Parallel scientific simulations, verification of concurrent software, health IT systems.
Teaching: Parallel and distributed systems, impact of computing on society.

Argus Group—Cyber Security Research
http://people.cis.ksu.edu/~xou/argus/
CISA—Center for Information and Systems Assurance
http://www.cis.ksu.edu
The Argus group carries out cyber security research under the direction of Dr. Simon Ou. Argus’ focus is on the defense aspect of cyber warfare, and our philosophy is that successful cyber defense can only be achieved through automated coordination of various observation and action points in an enterprise environment. Traditional solutions like firewalls and IDS systems are limited in effectiveness, since they only look at one aspect of the system and lack the capability of “connecting the dots” among various information sources to gain a global picture of a system’s security status. Our research aims at providing enabling technologies for such automated correlation and analysis with solid theoretical foundation and empirical study.
Argus is part of the Center for Information and Systems Assurance (CISA) at Kansas State University, an umbrella organization established in 2009 for all cybersecurity and information assurance research in the university. Faculty at CISA conduct research in computer and network security, high-assurance software systems, language-based security in health IT systems and security in distributed sensor systems. CISA has extensive collaboration with a number of external industry and government partners such as Rockwell Collins, HP Labs, DRDC-Ottawa, National Institute of Standards and Technology, Idaho National Laboratory, JAI Inc. and Telcordia Technologies. Research in CISA is funded by the National Science Foundation, Department of Defense and a number of industry partners.

Machine Learning and Bioinformatics (MLB) Group
http://people.cis.ksu.edu/~dcaragea/mlb
The MLB group is collaborating with the artificial intelligence and machine learning group at Iowa State University to produce an open-source system for knowledge acquisition and information integration from semantically heterogeneous data sources (NSF funding), and with the Bioinformatics Center at Kansas State University to produce bioinformatics and genomics tools (funding from K-State EcoGen and Targeted Excellence Program).

Collaborative Work on Computational Engineering – M. Neilsen
www.damsafety.info
The U.S. Department of Agriculture (USDA) and U.S. Army Corps of Engineers (USACE) are partnering with Kansas State University to incorporate research and field experience into computational tools for use in design and analysis of water-control structures. These tools provide the basis for optimal use of natural materials such as vegetation to protect embankments and spillways. Tools developed or under development through this cooperative work were highlighted in a booth at the Association of State Dam Safety Officials’ (ASDSO) Annual Conference in 2009. Current work involves developing tools to analyze...
breach failures and tools to perform risk assessment across the United States. Other computational engineering research uses finite-element analysis (FEA) to develop a turbo, solder interconnect predator (Sandia TurboSIP) tool to evaluate Pb-free solder joints in electronic control packaging for satellite systems, etc.

**Distributed Systems Lab**
http://www.cis.ksu.edu/becat

The Distributed Systems Lab supports a wide range of interdisciplinary research around a core interest in efficient, effective distributed systems. Key projects include the K-State research computing cluster, BecoCat, the largest academic cluster in Kansas with 1,000 cores, enhancing the efficiency of SOAP/XML communications; medical informatics; ecological modeling; and veterinary telemedicine. Our work is frequently cross-disciplinary and common collaborators go beyond engineering, ranging from agricultural economics to veterinary medicine. Since 1998, the Distributed Systems Lab has received funding from agencies such as the National Science Foundation, U.S. Forest Service and Environmental Protection Administration, U.S. Department of Agriculture and NSF EPSCoR.

**KDD Lab**
http://www.kdd.cis.ksu.edu/forsar

The laboratory for Knowledge Discovery in Databases (KDD lab) aims at developing technologies for building models of events and processes from data, and then using these models to help make decisions. Research in the KDD lab focuses on developing algorithms and techniques for the following:

- data mining, machine learning, and probabilistic reasoning over large data sets and text collections
- human language technologies: computational linguistics and information extraction
- visualization, learning, and reasoning about events and event streams
- analysis of spatial data: georeferencing, spatial outlier detection, deduplication, etc.
- modeling cognitive processes to better understand how humans reason about causality, especially with spatial and temporal data

Applications of these algorithms include software tools for bioinformatics, epidemiology, health informatics, computational physics, sensor network optimization and computer security. Tools developed by the lab have been used by the Department of Defense, Office of Naval Research (ONR), Army Research Lab (ARL), National Agricultural Biosecurity Center (NABRC) and Kansas Department of Transportation (KDOT). Federal and corporate sponsors of the KDD lab since 1999 include the NSF, DHS, ONR, ARL, Raytheon and American Diagnostic Medicine.

The KDD lab maintains a research collaboration with the University of Illinois at Urbana-Champaign, including the National Center for Supercomputing Applications (NCSA). The KDD lab supports multidisciplinary research and address challenges posed by the next generation of sensor systems.

**MACR Laboratory**
http://macr.cis.ksu.edu

The MultiAgent and Cooperative Robotics (MACR) Laboratory focuses on applying software engineering methods, techniques, and models to the design and development of intelligent, complex, adaptive and autonomous multiagent systems.

Current research focuses on building the tools and techniques necessary to design and build cooperative robotic systems, where the robots work autonomously but cooperate as part of a team. This research also includes building and developing hybrid intelligent systems that include humans, software agents and mobile hardware agents. Key elements of this work are:

- a set of methods and techniques for analyzing and designing complex, adaptive systems
- a set of organization-based models upon which the system analysis, design and implementation are based
- a set of generic technologies that implement organization-based models
- a set of multiagent and cooperative robotic systems used to demonstrate our approaches

The lab has produced the organization-based multiagent systems engineering methodology (OMaSE) and its associated tool development environment. The MACR Lab is collaborating with the Human-Machine Teaming Laboratory at Vanderbilt University to integrate humans as teammates into cooperative robotics teams. Since 2002, the MACR Lab has received more than $3.8 million in funding from the National Science Foundation, the Air Force Office of Scientific Research, United States Marine Corps, M2 Technologies and Stanford Systems Inc.

**SAnToS Laboratory**
http://santos.cis.ksu.edu

The Laboratory for Specification, Analysis and Transformation of Software (SAnToS) aims to develop technologies and tools for effective construction of high-confidence software systems. Work in the lab emphasizes:

- use of rigorous analysis techniques with solid mathematical underpinnings
- a variety of forms of code and model-integrated software specifications to capture crucial system correctness properties, and
- use of software models as a key mechanism for capturing essential software structure leading to system analysis and verification.

The lab has produced tools including the Bandera and Bogor software model checking frameworks, the Cadena modeling frameworks for component-based systems, and the Indus static and analysis and slicing frameworks that are widely recognized within the academic software engineering and verification communities. SAnToS researchers are currently focusing on applications in security, software product lines, integrated medical devices and sensor networks. Since 1999, SAnToS Laboratory has received more than $8.5 million in funding through agencies and companies such as the National Science Foundation, Army Research Office, Air Force Office of Scientific Research, Defense Department Advanced Projects Agency (DARPA), NASA, Lockheed Martin, Rockwell Collins, IBM, Honeywell and Intel.

**The Sensor Networks Laboratory**
http://persnl.cis.ksu.edu

The Sensor Networks Laboratory is conducting research to develop tools and methodologies for development of sensor applications, and supports multidisciplinary research that draws on faculty expertise from several disciplines. The lab has the following goals:

- develop model-driven tools for designing and deploying large-scale sensor networks
- provide the infrastructure support necessary to enable K-State researchers to perform multidisciplinary research and address challenges posed by the next generation of sensor systems
- provide laboratory support in various courses to educate and train students for networking and distributed computing research

The lab is currently supported by the K-State’s Targeted Excellence Program to promote multidisciplinary research. With additional instrumentation support grants from NSF and DoD, an experimentation test bed has been established to rapidly prototype large-scale sensor applications and to evaluate developed technologies. Multidisciplinary projects in the areas of veterinary telemedicine, hydrology, grain science, agronomy, agricultural engineering and environmental monitoring are being pursued in collaboration with researchers from several departments in engineering, veterinary medicine, agronomy and agriculture.

- Panelist, NSF CCF Program Panel, 2010.

Schmidt
- Steering committee, Static Analysis Symposium, 2010.
- Steering committee, VMCAI (Verification, Model Checking, and Abstract Interpretation) and secretary of the VMCAI Corporation, 2010.

Singh
- Panelist, Graduate Research Fellowship Program Panel, February 2010.
- Panelist, CNS Program Panel, April 2010.
- Publications chair, IASTED International Conference on Parallel and Distributed Computing and Systems, November 2010.
The CIS department offers two B.S. degrees: one in information systems (IS) and one in computer science (CS). The CS degree program now has two options:

- a traditional computer science track, which focuses on foundational and scientific issues, including courses on operating systems and databases; and
- a software engineering track, which focuses on software development, including enterprise information systems, project management, software security, parallel programming and software development in a team environment.

Both degree programs allow students flexibility in their programs of study. Students are encouraged to pursue a minor or to study interdisciplinary subjects while still completing their degrees within four years.

Computer science requirements for each of the three options have a core consisting of 16 credit hours and an option-specific set of 17 hours of advanced courses. The 16 credit-hour core also serves as the minor in computer science.

ACM Student Chapter

The local ACM chapter is a professional organization for CIS majors. Average attendance at monthly meetings is 30-40 students. Typically more than a dozen attend the ACM regional programming contest for a chance to interact with their peers and develop professional skills.

AAAI Robotics Competition

The joint undergraduate and graduate robotics team prepares to participate in robotics events at the annual convention of the Association for the Advancement of Artificial Intelligence. The team has competed each of the last five years in this event, a popular project for both undergraduate and graduate students.

The department of computing and information sciences is committed to excellence in scholarly activities in research and graduate teaching. We offer courses and a rich variety of projects in the areas of programming languages, high-assurance software, distributed computing, networking, software engineering, bio-informatics, computer security and data mining. In addition to basic research, our curriculum emphasizes collaborative and interdisciplinary research, collaboration with industrial partners, and development and distribution of software tools. We offer two master-level degrees, the master of science (M.S.) and master of software engineering (M.S.E.), and the doctor of philosophy degree in computer science. We offer the M.S.E. degree via distance learning, and a graduate certificate program in real-time embedded systems in collaboration with other engineering departments.

Admission requirements

Applicants for our graduate degrees must possess a bachelor’s degree, with at least a 3.0 grade point average or equivalent, from an accredited institution. Students not possessing a degree in computer science must have background that includes the equivalent of core undergraduate computer science courses.

Areas of concentration

Programming language, high-assurance software, distributed computing, networking, software engineering, bio-informatics, computer security and data mining, high-performance computing.

Certificate program

Graduate certificate in real-time embedded systems.

234 Nichols Hall
Kansas State University
Manhattan, KS 66506 USA
Phone: 785-532-6350; Fax: 785-532-7353;
email: cis-gradapps@ksu.edu
The CIS advisory board is composed of leaders in the development and deployment of software in industry. Because software is pervasive throughout our society, these advisors are technical, management and executive leaders in a broad spectrum of industrial sectors—software development, e-commerce, health IT, transportation, manufacturing, retail, communications, health management, military and academia. This industrial leadership helps us in three ways:

- Through industrial and university affiliations, it connects us to our alumni, practicing professionals, industry leaders, government leaders and academic researchers. These connections enable us to build collaborative relationships between academia and industry.
- It provides advice on the "state of the practice" in the software industry. This perspective helps us better prepare students for the software development profession, and better integrate our research results into real products and industrial processes.
- Advisory board members provide financial support from both personal and industry sources.

Advisory Board

Susan Chambers
Executive Vice President
Wal-Mart

Katherine (Kacy) Clark
Vice President
Wellington Management Company

Terry Ecklund
Director, Strategic Initiatives
Triple I Consulting

Lynn Frick
Database Administrator
Kansas State University Foundation

Dominic Gelinas
Programmer
Texas Instruments

Dr. Mary Lou Hines
Vice Provost
UMKC (Board Chair)

Connie Jaynes
Retired
Shell Oil

Martin Malley
Vice President of Information Technology
Union Pacific

Don Mounday
President
Falcon Technology Group

Shane Runquist
Software Engineer
Garmin

Mark Schonhoff
Vice President
Cerner Corp

Ken Switzer
President
Pegasus Programming Solutions

Norman Tsiguloff
Business Management Executive
Oxford Companies, LLC

Neil Tucker
Retired
PeopleSoft

Dr. Ray Vaughn
Associate Vice President for Research
Mississippi State University

Dr. Tieren Zhou
Founder and President
Techexcel Corp.

Emeritus Members

Jerry Havemann
Vice President, Retired
Cargill

Jacqueline Trombly
Operations Director, Retired
Liaent Inc.

Dennis Yeo
Founder
